Span	<input type="radio"/> Linear	<input checked="" type="radio"/> DeciBel = 10log(Span)	<input checked="" type="checkbox"/> BMP

Buttons:

### Description:

Creates binary files corresponding to the modulus and argument of the (4x4) complex Covariance matrix ([C4]) raw binary data.  
An option may be set to simultaneously create the corresponding bitmap image files.

### Comments:

Parameters written in Red can be modified directly by the user from the keyboard.

### Input/Output Arguments:

**Input Directory** Indicates the complete location of the considered **MainDirectory / C4 (MD / C4)** containing the [C4] matrix data to be processed.

**Output  
Directory**

Indicates the location of the processed data output directory.  
The default value is set automatically to :  
**MainDirectory / C4 (MD / C4).**

**Output Image Number of Rows/Columns:**

The output image numbers of rows and columns are initialised to the input data set dimensions.

Users wishing to process a sub-part of the initial image can modify the **Init** and **End** values of the converted images rows and columns.

**Note:** init and end values have to remain within the range defined by the input image dimensions.

**Selection of the Channels to be Processed:**

Several channels may be processed at a time. The selection of the BMP options enables the creation of output bmp files.

Users may choose between three types of output binary data :

- **Modulus** : Linear representation of the considered [**C4**] element amplitude. Output file name : Cij\_mod.bin (.bmp)
  - **Modulus** : Element amplitude in dB= $10\log_{10}(\text{Modulus})$ . Output file name : Cij\_dB.bin (.bmp)
  - **Phase** : Argument of the considered complex [**C4**] element (Only available for off-diagonal elements). Output file name : Cij pha.bin (.bmp)
  
  - **Span** : Corresponds to the sum of the diagonal elements of [**C4**], may also be processed (linear and dB) using this program.
-
