

## My Function - Create

### Description:

The PolSARpro Software is conceived as a flexible and open software environment where users can easily add new functions and components, as their need arises. This functionality allows the user to automatically include and define its own additional functions in the software.

### Comments:

Parameters written in Red can be modified directly by the user from the keyboard.

### Input Arguments:

**Function Name** Correspond to the name of the function to be included in the software.

**Function Path** Correspond to the path where will be copied the function to be included in the software. All the user functions will be automatically copied under the directory: [Soft/tools/MyRoutines/](#)

### Parameters Definition:

- New** Create a new [Input Variable](#)
- Del** Delete the current [Input Variable](#)
- Move in the up / down direction in the [Input Variable](#) list
- Clear** Clear the parameters definition of the current [Input Variable](#).
- Reset** Delete the [Input Variable](#) list and the associated parameters.

**Variable Name** Name of the current **Input Variable**  
**Variable Type** Type of the current **Input Variable**
